         * @typedef {Object<string, any>} Data
         * @property {boolean} success - Whether the login was successful
         * @property {string} token - The data returned from the login i.e. Fire Token
         */

        // data.token is the message sent from the fireOAuthChannel after verification
        // data.success is a boolean that indicates whether the verification was successful
        // data.token is the fire token
        // What to do with the Fire Token?

        // * Fire Token is an unique token which uniquely identifies the user who authorized your login attempt
        with Fire

        // * You can use this token ONLY ONCE as it will be destroyed after the first use

        // 1. Send the fire token to the Fire Server to verify the user

        // - You can do that client sided or server sided

        // - You need to send a POST Request to the Fire Server with the fire token

        // at the URL: http://localhost:3003/api/tokens/verify

        // - The Fire Server will verify the fire token and return a response

        // - If the verification was successful - CODE (200), the Fire Server will return a response with the
        user's data

        // - If the verification was unsuccessful - CODE (400) or CODE (401), the Fire Server will return a
        response with an error 'message'

        // - You can use the data returned from the Fire Server to create a new user in your database

        // This example will send the token to Fire Servers and console.log the response
        console.log("%c" + `Fire Token: ${data.token}`, `color: #f1c40f; font-weight: bold;`);

        // data.success is a boolean that indicates whether the verification was successful
        // data.token is the fire token

```

```

// What to do with the Fire Token?

// * Fire Token is an unique token which uniquely identifies the user who authorized your login attempt
with Fire

// * You can use this token ONLY ONCE as it will be destroyed after the first use

// 1. Send the fire token to the Fire Server to verify the user

// - You can do that client sided or server sided

// - You need to send a POST Request to the Fire Server with the fire token

//   at the URL: http://localhost:3003/api/tokens/verify

// - The Fire Server will verify the fire token and return a response

//   - If the verification was successful - CODE (200), the Fire Server will return a response with the
user's data

//   - If the verification was unsuccessful - CODE (400) or CODE (401), the Fire Server will return a
response with an error 'message'

// - You can use the data returned from the Fire Server to create a new user in your database

// This example will send the token to Fire Servers and console.log the response
console.log("%c" + `Fire Token: ${data.token}`, `color: #f1c40f; font-weight: bold;`);

  border-radius: 12px;
```

**cursor: pointer;**

}

The screenshot shows a web browser window with the URL `gdb.com/online_html_compiler`. The browser's address bar and tabs are visible. The main content area displays a code editor with the following CSS code:

```
75 margin: 0.1rem 0.1rem 0.8rem;  
76 padding: 1rem 0.8rem 0;  
77 }  
78
```

Below the code editor, there is a preview window titled "input" showing a rendered HTML card component. The card has a white background, a thin gray border, and a rounded top-left corner. It contains a heading, a right-aligned action button, and a list of actions. The CSS code in the editor defines the styling for these elements, including margins, padding, font-family, and colors.
